Metabolisable energy: 4000 Kcal/kg

A diet is based on the animal's Metabolisable Energy requirements. Metabolisable Energy is defined as the energy in a food that is actually absorbed and used by the animal to perform all of its functions.

Energy balance prevents cholesterol

It is important to choose a food studied to supply the animal with the amount of energy it actually needs. Each dog, based on its size, age, habits and lifestyles requires a balanced supply of nutritional elements, thus preventing the accumulation of cholesterol.

Croquette size suitable for teeth and jaws

A dog's size can vary significantly depending on its size and age, consequently even teeth and jaws vary in size. For this reason, it is important for the croquettes to be of the specific size so as not to tire the dog during chewing, improving ingestion and digestion.

Rich in Omega-3 and Omega-6 younger skin

A shiny and healthy coat is not only an aesthetic factor. The haircoat performs numerous functions, including thermal insulation and protection from the harmful rays of the sun and of atmospheric agents. A correct supply of Omega-3 and Omega-6 essential fatty acids is important for the coat to preserve its characteristics.
